#### Introduction

The TMS FNC TreeView offers a wide range of features to enhance your applications.

- High performance virtual and collection-based mode able to easily deal with millions of nodes
- Multi-line HTML formatted text
- Various built-in column editors
- Multi-column support
- Fixed and variable node height and node auto sizing
- Multiple events for custom drawing and customization of default drawing
- Multiple events for all kinds of interactions such as editing, expand / collapse and selection
- Auto-sizing and stretching of columns
- Mouse and keyboard interaction
- Nodes with checkbox, radiobutton, image, disabled nodes
- Nodes extending over multiple columns
- TTMSFNCCheckedTreeView

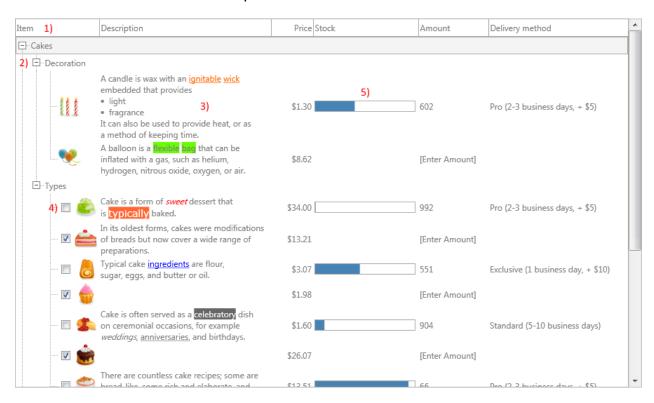

The TMS FNC TreeView is designed for use with Win32, Win64, Mac OS-X, iOS and Android operating systems.

#### Organization

Below is a quick overview of the most important elements in the TreeView. This guide will cover all elements in different chapters.

- 1) Columns / Column groups, which are added through the Columns / Groups collection. Columns based settings can override the default appearance for nodes. Via Columns a header and configure text alignment, wordwrapping and appearance can be specified.
- 2) Nodes: Holds a set of values such as the text, icon and check state that are represented in each column. Nodes can have child nodes and when child nodes are added, an expand/collapse icon is shown.
- 3) HTML formatted text: The node can display HTML formatted text for each column. Simply add the supported HTML tags and the TreeView will automatically switch to HTML.
- 4) Checkbox / Radiobutton support is added for each column Additionally an icon can be specified for each column as well.
- 5) Customization: Each element in the TreeView can be fully customized. In the above sample a progressbar is drawn to indicate a certain level of stock instead of text.

#### Modes

The TreeView supports a collection-based and a virtual mode. Both modes will be explained in this chapter together with a small sample. You will notice that each programmatic call to manipulate / interact with nodes has a virtual and a collection-based version of the node. By default a collection-based TreeView is used. Below is a screenshot on how a default TTMSFNCTreeView instance looks like when dropped on the form.

Model	Year	Miles
Audi		
A3	2010	32,300
□-A5 series		
S5	2015	40,000
RS5	2012	15,000
A8	2005	80,000
- Mercedes		
SLS	2000	300,000
SLK	2010	20,000
GLA	2012	14,500

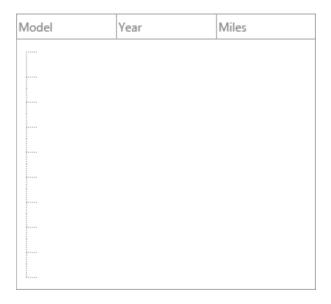

# <u>Virtual</u>

The TreeView will retrieve its values for each column and the number of nodes/child nodes through events. Each event that retrieves the node values passes an ANode parameter of type TTMSFNCTreeViewVirtualNode. The most important event to start with is the OnGetNumberOfNodes event. This event retrieves the number of nodes during creation of the TreeView. The event is also called for child nodes after successfully retrieving the child count for each node. The first level of nodes is -1 (under root) which is the initial display of nodes and can be accessed with the ANode parameter in the OnGetNumberOfNodes event. Below is a sample that demonstrates this.

```
procedure TForm1.TMSFNCTreeView1GetNumberOfNodes(Sender: TObject;
   ANode: TTMSFNCTreeViewVirtualNode; var ANumberOfNodes: Integer);
begin
   if ANode.Level = -1 then
        ANumberOfNodes := 10;
```

#### end;

Note that this sample code is executed on a default TTMSFNCTreeView instance dropped on the form without any properties changed. As you will notice, the default columns are still used while the nodes (i.e. default collection based) are removed.

When continuing with our virtual mode based TreeView you will notice that the text of the nodes is missing. To further define the setup of the TreeView, we will remove the default columns and add new columns to the TreeView. Additionally we will specify text for each node through the OnGetNodeText event.

```
TMSFNCTreeView1.BeginUpdate;
TMSFNCTreeView1.Columns.Clear;
TMSFNCTreeView1.Columns.Add.Text := 'Column 1';
TMSFNCTreeView1.Columns.Add.Text := 'Column 2';
TMSFNCTreeView1.EndUpdate;

procedure TForm1.TMSFNCTreeView1GetNodeText(Sender: TObject;
   ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer;
   AMode: TTMSFNCTreeViewNodeTextMode; var AText: string);
begin
   AText := 'Node ' + inttostr(ANode.Index) + ' for ' +
TMSFNCTreeView1.Columns[AColumn].Text;
end;
```

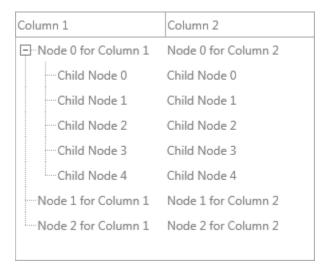

# tmssoftware; com

Column 1	Column 2
Node 0 for Column 1	Node 0 for Column 2
Node 1 for Column 1	Node 1 for Column 2
Node 2 for Column 1	Node 2 for Column 2
Node 3 for Column 1	Node 3 for Column 2
Node 4 for Column 1	Node 4 for Column 2
Node 5 for Column 1	Node 5 for Column 2
Node 6 for Column 1	Node 6 for Column 2
Node 7 for Column 1	Node 7 for Column 2
Node 8 for Column 1	Node 8 for Column 2
Node 9 for Column 1	Node 9 for Column 2

To add child nodes for each node the level of the nodes is identified with the level property on the ANode parameter. Note from the first sample that the level is -1 for the root nodes. For all root child nodes that are added the level is 0 or larger. Each node has an Index parameter and a Row parameter to uniquely identify each node. The following sample adds 3 root nodes and adds 5 child nodes for the first root node.

```
procedure TForm1.TMSFNCTreeView1GetNumberOfNodes(Sender: TObject;
  ANode: TTMSFNCTreeViewVirtualNode; var ANumberOfNodes: Integer);
begin
  if ANode.Level = -1 then
   ANumberOfNodes := 3
  else if (ANode.Level = 0) and (ANode.Index = 0) then
    ANumberOfNodes := 5;
end;
procedure TForm1.TMSFNCTreeView1GetNodeText(Sender: TObject;
  ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer;
 AMode: TTMSFNCTreeViewNodeTextMode; var AText: string);
begin
  if ANode.Level = 0 then
    AText := 'Node ' + inttostr(ANode.Index) + ' for ' +
TMSFNCTreeView1.Columns[AColumn].Text
  else
    AText := 'Child Node ' + inttostr(ANode.Index)
end;
```

Each property that affects the node text, icon, check state, ... can be configured through the OnGetNode\* events. Alternatively a collection-based approach can be used which is explained below. When using a virtual TreeView all virtual procedures, functions and properties need to be used. Below is a sample that expands all nodes in a virtual TreeView.

```
TMSFNCTreeView1.ExpandAllVirtual;
```

## Collection-based

A collection-based TreeView uses nodes from the Nodes collection property. Each node represents a set of values for each column that can be accessed through the Values property. Below is the same sample as in the Virtual mode, but then created through the Nodes collection.

```
I: Integer;
C: Integer;
K: Integer;
pn: TTMSFNCTreeViewNode;

begin

TMSFNCTreeView1.BeginUpdate;
TMSFNCTreeView1.ClearColumns;
TMSFNCTreeView1.ClearNodes;
TMSFNCTreeView1.Columns.Add.Text := 'Column 1';
TMSFNCTreeView1.Columns.Add.Text := 'Column 2';
for I := 0 to 2 do
```

# tmssoftware; com

```
begin
    pn := TMSFNCTreeView1.AddNode;
    for C := 0 to TMSFNCTreeView1.Columns.Count - 1 do
      pn.Text[C] := 'Node ' + inttostr(I) + ' for ' +
TMSFNCTreeView1.Columns[C].Text;
    if I = 0 then
   begin
      for K := 0 to 4 do
     begin
        childn := TMSFNCTreeView1.AddNode(pn);
        for C := 0 to TMSFNCTreeView1.Columns.Count - 1 do
          childn.Text[C] := 'Child Node ' + inttostr(K);
      end;
    end;
  end;
 TMSFNCTreeView1.EndUpdate;
end;
```

Column 1	Column 2
Node 0 for Column 1	Node 0 for Column 2
Child Node 0	Child Node 0
····Child Node 1	Child Node 1
Child Node 2	Child Node 2
Child Node 3	Child Node 3
Child Node 4	Child Node 4
Node 1 for Column 1	Node 1 for Column 2
Node 2 for Column 1	Node 2 for Column 2

When using a collection-based TreeView the information of each node such as the position, height, level, ... is stored in the TTMSFNCTreeViewVirtualNode object which is the same object being used in the virtual mode. Each collection-based node has a reference to the virtual node through the VirtualNode property. When using a collection-based TreeView the non-virtual procedures / functions an properties need to be used. Below is a sample that expands all nodes in a collection-based TreeView.

```
TMSFNCTreeView1.ExpandAll;
```

#### **Columns**

### Configuration / Appearance

The columns are configured through the Columns collection. Each column displays a set of values for each node such as the text, icon and check state. The most important property for a column is the UseDefaultAppearance property which is used to switch between the properties set at ColumnsAppearance level or the properties on the column collection item level for controlling the appearance of a column. Per column, horizontal, vertical text alignment as well as trimming and word wrapping can be configured. Fine-tuning is possible through a variety of events. Below is a sample that explains the difference between using the default appearance and customizing the appearance with the UseDefaultAppearance = false property per column.

In the following sample, we want to customize the font color and size of the header of the column and the font color of the nodes. For this we need to set the ColumnsAppearance.TopFontColor, the ColumnsAppearance.TopFont and the NodesAppearance.FontColor properties. Note that the NodesAppearance covers the nodes area while the ColumnsAppearance covers the columns area.

```
var
 n: TTMSFNCTreeViewNode;
 TMSFNCTreeView1.BeginUpdate;
 TMSFNCTreeView1.Nodes.Clear;
 TMSFNCTreeView1.Columns.Clear;
 TMSFNCTreeView1.Columns.Add.Text := 'Column 1';
 TMSFNCTreeView1.Columns.Add.Text := 'Column 2';
 n := TMSFNCTreeView1.AddNode;
 n.Text[0] := 'Node 0 for Column 1';
 n.Text[1] := 'Node 0 for Column 2';
 n := TMSFNCTreeView1.AddNode;
 n.Text[0] := 'Node 1 for Column 1';
 n.Text[1] := 'Node 1 for Column 2';
 n := TMSFNCTreeView1.AddNode;
 n.Text[0] := 'Node 2 for Column 1';
 n.Text[1] := 'Node 2 for Column 2';
 TMSFNCTreeView1.ColumnsAppearance.TopFont.Size := 16;
```

```
TMSFNCTreeView1.ColumnsAppearance.TopFontColor := gcOrange;
TMSFNCTreeView1.NodesAppearance.FontColor := gcSeagreen;
TMSFNCTreeView1.EndUpdate;
end;
```

Column 1	Column 2
Node 0 for Column 1	Node 0 for Column 2
Node 1 for Column 1	Node 1 for Column 2
Node 2 for Column 1	Node 2 for Column 2

Let's say we add a third column, and don't want to take on the default appearance, but instead use a different color for the header and nodes text and we don't change the font size. Additionally we also apply trimming. Below is a sample that demonstrates this.

```
var
  n: TTMSFNCTreeViewNode;
begin
  TMSFNCTreeView1.BeginUpdate;
 TMSFNCTreeView1.Nodes.Clear;
  TMSFNCTreeView1.Columns.Clear;
  TMSFNCTreeView1.Columns.Add.Text := 'Column 1';
  TMSFNCTreeView1.Columns.Add.Text := 'Column 2';
  TMSFNCTreeView1.Columns.Add.Text := 'Column 3';
  TMSFNCTreeView1.Columns[2].UseDefaultAppearance := False;
  TMSFNCTreeView1.Columns[2].Trimming := tvttWord;
  n := TMSFNCTreeView1.AddNode;
  n.Text[0] := 'Node 0 for Column 1';
  n.Text[1] := 'Node 0 for Column 2';
  n.Text[2] := 'Node 0 for Column 3';
  n := TMSFNCTreeView1.AddNode;
  n.Text[0] := 'Node 1 for Column 1';
  n.Text[1] := 'Node 1 for Column 2';
  n.Text[2] := 'Node 1 for Column 3';
  n := TMSFNCTreeView1.AddNode;
  n.Text[0] := 'Node 2 for Column 1';
  n.Text[1] := 'Node 2 for Column 2';
  n.Text[2] := 'Node 2 for Column 3';
```

```
TMSFNCTreeView1.ColumnsAppearance.TopFontColor := gcOrange;
TMSFNCTreeView1.ColumnsAppearance.TopFont.Size := 16;
TMSFNCTreeView1.NodesAppearance.FontColor := gcSeagreen;
TMSFNCTreeView1.EndUpdate;
end;
```

```
Column 1 Column 2 Column 3

Node 0 fo Node 0 for Co Node 0 for...

Node 1 fo Node 1 for Co Node 1 for...

Node 2 fo Node 2 for Co Node 2 for...
```

As you will notice, the default font color for both the header and the nodes is gray which can be set on column level with the properties Column[Index]. TopFontColor and Column[Index]. FontColor. The following sample adds 2 additional lines to the previous sample to configure this.

```
TMSFNCTreeView1.Columns[2].TopFontColor := gcRed;
TMSFNCTreeView1.Columns[2].FontColor := gcPurple;
```

```
Column 1 Column 2 Column 3

Node 0 fo Node 0 for Co Node 0 for...

Node 1 fo Node 1 for Co Node 1 for...

Node 2 fo Node 2 for Co Node 2 for...
```

# Autosizing and stretching

When dropping a TreeView instance on the form, you will notice that it already has three columns and has default behavior of stretching those columns to fit the width of the control. The TreeView exposes the ability to stretch all columns, or a specific column. When turning off stretching completely each column has its own Width property that can be used to set a fixed width for a column.

Below is a sample of the default TreeView and a sample after the width of the TreeView has been changed.

#### default

# tmssoftware:com

Model	Year	Miles
Audi		
A3	2010	32,300
□-A5 series		
S5	2015	40,000
RS5	2012	15,000
A8	2005	80,000
- Mercedes		
SLS	2000	300,000
SLK	2010	20,000
GLA	2012	14,500

#### width changed

Model	Year	Miles
Audi		
A3	2010	32,300
□ A5 series		
S5	2015	40,000
RS5	2012	15,000
A8	2005	80,000
SLS	2000	300,000
SLK	2010	20,000
GLA	2012	14,500

As explained, the default behavior of the columns is to stretch. Below is a sample that turns off stretching for all columns except for a specific column and instead automatically uses the leftover width.

```
TMSFNCTreeView1.ColumnsAppearance.StretchAll := False;
TMSFNCTreeView1.ColumnsAppearance.StretchColumn := 1;
```

Model	Year	Miles
Audi		
A3	2010	32,300
□ A5 series		
S5	2015	40,000
RS5	2012	15,000
A8	2005	80,000
- Mercedes		
····SLS	2000	300,000
····SLK	2010	20,000
GLA	2012	14,500

Turning off stretching completely with the Stretch property will allow the TreeView to fall back on the width property of each column which is 100 by default.

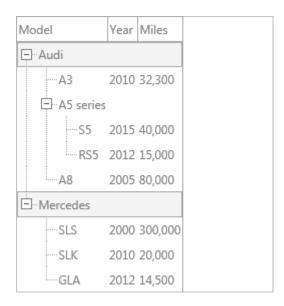

TMSFNCTreeView1.ColumnsAppearance.Stretch := False;

Model	Year	Miles
Audi		
A3	2010	32,300
□ A5 series		
S5	2015	40,000
RS5	2012	15,000
A8	2005	80,000
- Mercedes		
SLS	2000	300,000
····SLK	2010	20,000
GLA	2012	14,500

Autosizing can be done only when the Stretch property is set to false. The ability is included to autosize on double-click on the column header splitter line, but this feature is explained in the Interaction chapter. When programmatically autosizing the visible nodes, column header for top and bottom layouts are take into calculation to determine the width for a column. Below is a sample that applies autosizing on all three columns, after turning off stretching.

```
I: Integer;
begin
   TMSFNCTreeView1.ColumnsAppearance.Stretch := False;
   for I := 0 to TMSFNCTreeView1.Columns.Count - 1 do
        TMSFNCTreeView1.AutoSizeColumn(I);
end;
```

Note that autosizing is only applied to the visible nodes, so collapsed nodes and nodes that fall outside the visible region will not be taken into calculation. To support autosizing on expand/collapse and scrolling, events can be used to accomplish this.

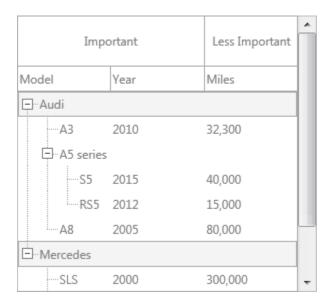

## Groups

# **Configuration**

Groups are used to add additional information to columns. They can be added to multiple columns or simply cover one column. Below is a sample that adds 2 groups for 3 columns, one group that is used for the first column and a group that stretches of the last 2 columns.

```
grp: TTMSFNCTreeViewGroup;
begin
   grp := TMSFNCTreeView1.Groups.Add;
   grp.StartColumn := 0;
   grp.EndColumn := 1;
   grp.Text := 'Important';

   grp := TMSFNCTreeView1.Groups.Add;
   grp.StartColumn := 2;
   grp.EndColumn := 3;
   grp.Text := 'Less Important';
end;
```

Note that in this case, the additional groups decrease the available space for nodes so a vertical scrollbar is needed to make sure all nodes are reachable.

### **Appearance**

As with the columns, the groups have their own appearance control. The default appearance is stored under the GroupsAppearance property and can be overridden with the UseDefaultAppearance property per group. Below is a sample that demonstrates this.

# grp: TTMSFNCTreeViewGroup; begin TMSFNCTreeView1.BeginUpdate; grp := TMSFNCTreeView1.Groups.Add; grp.StartColumn := 0; grp.EndColumn := 1; grp.Text := 'Important'; grp := TMSFNCTreeView1.Groups.Add; grp.StartColumn := 2; grp.EndColumn := 3; grp.Text := 'Less Important'; grp.UseDefaultAppearance := False; grp.TopFill.Color := gcRed; grp.TopFill.Kind := TBrushKind.Solid; grp.TopFontColor := gcWhite; TMSFNCTreeView1.GroupsAppearance.TopFont.Size := 16; TMSFNCTreeView1.GroupsAppearance.TopFont.Style := [TFontStyle.fsBold]; TMSFNCTreeView1.GroupsAppearance.TopFontColor := gcSeagreen; TMSFNCTreeView1.EndUpdate; end;

TMS SOFTWARE
TMS FNC TreeView
DEVELOPERS GUIDE

Nodes

### Configuration / Appearance

Nodes are the core data structure for the TreeView and as already explained in the Modes chapter, the TreeView can use a collection-based and virtual mode for displaying nodes. The virtual mode always starts by implementing the OnGetNumberOfNodes event and the collection-based mode starts with the Nodes collection property. Each collection-based node automatically generates a virtual node to hold the most important information such as the Index, Row, Level, Children and TotalChildren. For each event that is triggered, the virtual node is passed as a parameter, because when using only a virtual based TreeView, the values represented in each column need to be returned through events. When a collection-based TreeView is used, and events need to be implemented, each virtual node holds a reference to the collection item node (TTMSFNCTreeViewVirtualNode.Node) that is used and vice versa (TTMSFNCTreeViewNode.VirtualNode). Only when using a virtual TreeView the TTMSFNCTreeViewVirtualNode .Node property will be nil.

Important to know is that each procedure, function and property has a collection-based and a virtual implementation. Generally, the procedures, functions and properties without virtual in the name are used for a collection-based TreeView.

The appearance of the nodes is configured through the NodesAppearance property. As explained in the columns chapter, the nodes appearance can be overridden per column with setting UseDefaultAppearance = false.

# Adding, inserting and removing nodes

Adding, inserting and removing nodes are supported in both collection-based and virtual mode. As already explained, each mode has its own procedures, methods and events. In this chapter we start with an empty TreeView, so all nodes are removed from the collection which are added at designtime. Both collection-based and virtual add, insert and remove node methods will be explained here.

Each TreeView, whether it's collection-based or virtual will start without nodes and with a single column. The code to accomplish this is demonstrated below.

```
TMSFNCTreeView1.BeginUpdate;
TMSFNCTreeView1.ClearNodeList;
TMSFNCTreeView1.ClearColumns;
TMSFNCTreeView1.ClearNodes;
```

```
TMSFNCTreeView1.Columns.Add.Text := 'Column 1';
TMSFNCTreeView1.EndUpdate;
```

Additionally for the virtual TreeView implementation the OnGetNumberOfNodes always needs to be implemented and return at least one node. With virtual mode the text is empty by default, so the OnGetNodeText event needs to be implemented as well. The code below demonstrates this. Please note that the code below is only added in case a virtual TreeView mode is chosen.

```
procedure TForm1.TMSFNCTreeView1GetNodeText(Sender: TObject;
   ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer;
   AMode: TTMSFNCTreeViewNodeTextMode; var AText: string);
begin
   AText := 'Node ' + inttostr(ANode.Index);
end;

procedure TForm1.TMSFNCTreeView1GetNumberOfNodes(Sender: TObject;
   ANode: TTMSFNCTreeViewVirtualNode; var ANumberOfNodes: Integer);
begin
   if ANode.Level = -1 then
        ANumberOfNodes := 1;
end;
```

#### Adding a new node (virtual)

A new node is added with the code TMSFNCTreeView1.AddVirtualNode;. Note that the OnGetNodeText will be called returning a different text for the newly added node.

#### Adding a new node (collection-based)

In a collection-based TreeView, a node is added directly to the Nodes collection, or with the helper method <code>TMSFNCTreeView1.AddNode;</code>. To get the same result as with the virtual implementation, we need to add 2 nodes, because in the virtual mode, the first node was added through the <code>OnGetNumberOfNodes</code>, which isn't used in a collection-based TreeView.

```
Column 1

Node 0

Node 1
```

### Adding child nodes (virtual)

Child nodes can be added with the same function, but instead passing the parent node as a parameter. The following sample demonstrates how to add a child node to the second root node added with the AddVirtualNode method. Additionally, the parent node that is added together with the child node is expanded to visually the newly added child node.

```
pn, n: TTMSFNCTreeViewVirtualNode;
begin
  pn := TMSFNCTreeView1.AddVirtualNode;
  n := TMSFNCTreeView1.AddVirtualNode(pn);
  TMSFNCTreeView1.ExpandVirtualNode(pn);
end;
```

#### Adding child nodes (collection-based)

Child nodes can be added the same way as in the virtual mode, but with different method names. When we copy the above code and remove the Virtual keyword in the method name, the result output will be identical if we keep in mind that an additional node needs to be added in the collection to match the virtual node added with the OnGetNumberOfNodes.

```
pn, n: TTMSFNCTreeViewNode;
begin

pn := TMSFNCTreeView1.AddNode;
pn.Text[0] := 'Node 0';
pn := TMSFNCTreeView1.AddNode;
pn.Text[0] := 'Node 1';
n := TMSFNCTreeView1.AddNode(pn);
n.Text[0] := 'Node 0';
TMSFNCTreeView1.ExpandNode(pn);
end;
```

```
Column 1

Node 0

Node 1

Node 0
```

#### Inserting a new node

Inserting nodes is done in the same way as adding nodes, but an additional parameter can be passed specifying the insert position of the new node. In virtual mode, there isn't any difference between inserting and adding new nodes because the OnGetNodeText will return text based on the index of the node.

Additionally, in a collection-based TreeView, the index parameter of the collection item node can be used to switch positions with an already existing node, creating a move node functionality.

#### Removing an existing node (virtual)

Removing an existing node can be done with the RemoveVirtualNode method. The parameter to pass is an existing node. The following sample retrieves the focused node and removes it.

```
TMSFNCTreeView1.RemoveVirtualNode(TMSFNCTreeView1.FocusedVirtualNode);
```

#### Removing an existing node (collection-based)

In a collection-based TreeView, removing a node can be done in a similar way but without the Virtual keyword in the method name. Additionally a node can also be removed by freeing the collection item. Below code output is identical and removes the focused node on both cases.

```
TMSFNCTreeView1.RemoveNode(TMSFNCTreeView1.FocusedNode);
TMSFNCTreeView1.FocusedNode.Free;
```

# Fixed vs variable node height

A key feature of the TreeView in both collection-based and virtual mode is support for fixed and variable node height. The simplest configuration is the fixed node height where each node has the same height, based on the NodesAppearance. FixedHeight property. Word wrapping the text of a node or specifying a node icon will be based on the fixed height and thus exceeding the node bounds when the height of the text or the node icon is larger than the fixed height.

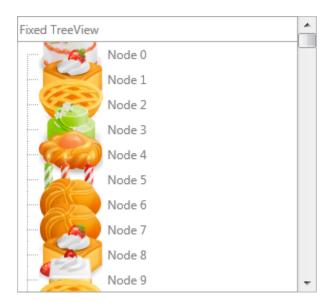

To support auto-sizing of nodes, based on the node icon or text, the NodesAppearance. HeightMode property needs to change to thhmVariable. The NodesAppearance. VariableMinimumHeight property is used to specify a minimum height for each node, so to initial total height for displaying a scrollbar can be calculated. The default value for this property is 25. Keep in mind that the TreeView needs to perform additional calculations during startup and during scrolling. Below is a sample that demonstrates the difference between a fixed and variable node height TreeView configuration. Both samples are demonstrated in a virtual TreeView implementation.

#### Fixed

```
TMSFNCTreeView1.BeginUpdate;
TMSFNCTreeView1.ClearNodeList;
TMSFNCTreeView1.ClearNodes;
TMSFNCTreeView1.ClearColumns;
TMSFNCTreeView1.Columns.Add.Text := 'Fixed TreeView';
TMSFNCTreeView1.EndUpdate;
procedure TForm1.TMSFNCTreeView1GetNodeText(Sender: TObject;
 ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer;
 AMode: TTMSFNCTreeViewNodeTextMode; var AText: string);
  AText := 'Node ' + inttostr(ANode.Index);
end;
procedure TForm1.TMSFNCTreeView1GetNumberOfNodes(Sender: TObject;
 ANode: TTMSFNCTreeViewVirtualNode; var ANumberOfNodes: Integer);
begin
  if ANode.Level = -1 then
    ANumberOfNodes := 1000000;
end;
procedure TForm1.TMSFNCTreeView1GetNodeIcon(Sender: TObject;
 ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ALarge:
Boolean;
```

```
var Alcon: TBitmap);
begin
  Alcon :=
TMSFNCBitmapContainer1.Items[Random(TMSFNCBitmapContainer1.Items.Count)].Bitmap;
end;
```

Note that the icons specified through the OnGetNodelcon event are too large to fit inside the fixed node height. The solution can be to specify a larger fixed height through the NodesAppearance. FixedHeight property, but when the values that need to be loaded are unknown, the fixed height approach is no longer valid. When switching to a variable row height mode you will notice that the node height will automatically take on the size of the icons.

```
TMSFNCTreeView1.BeginUpdate;
TMSFNCTreeView1.NodesAppearance.HeightMode := tnhmVariable;
TMSFNCTreeView1.ClearNodes;
TMSFNCTreeView1.ClearColumns;
TMSFNCTreeView1.Columns.Add.Text := 'Variable TreeView';
TMSFNCTreeView1.EndUpdate;

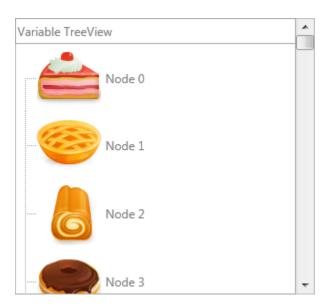

procedure TForm1.TMSFNCTreeView1GetNodeIcon(Sender: TObject;
   ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ALarge: Boolean;
   var AIcon: TBitmap);
begin
```

```
AIcon :=
TMSFNCBitmapContainer1.Items[Random(TMSFNCBitmapContainer1.Items.Count)].Bitmap;
end;

procedure TForm1.TMSFNCTreeView1GetNodeText(Sender: TObject;
   ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer;
   AMode: TTMSFNCTreeViewNodeTextMode; var AText: string);
begin
   AText := 'Node ' + inttostr(ANode.Index);
end;

procedure TForm1.TMSFNCTreeView1GetNumberOfNodes(Sender: TObject;
   ANode: TTMSFNCTreeViewVirtualNode; var ANumberOfNodes: Integer);
begin
   if ANode.Level = -1 then
        ANumberOfNodes := 1000000;
end;
```

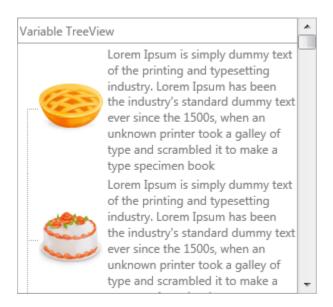

In case the text is larger than the node icon, the node height will automatically adapt as shown in the sample below.

```
TMSFNCTreeView1.BeginUpdate;
TMSFNCTreeView1.ClearNodeList;
TMSFNCTreeView1.NodesAppearance.HeightMode := tnhmVariable;
TMSFNCTreeView1.ClearNodes;
TMSFNCTreeView1.ClearColumns;
```

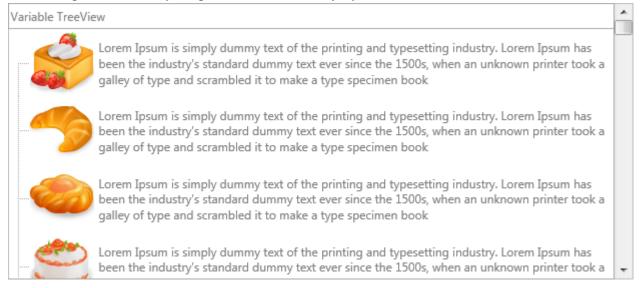

# tmssoftware; com

```
TMSFNCTreeView1.Columns.Add.Text := 'Variable TreeView';
TMSFNCTreeView1.Columns[0].WordWrapping := True;
TMSFNCTreeView1.EndUpdate;
procedure TForm1.TMSFNCTreeView1GetNodeIcon(Sender: TObject;
 ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ALarge:
Boolean;
 var Alcon: TBitmap);
begin
 Alcon :=
TMSFNCBitmapContainer1.Items [Random (TMSFNCBitmapContainer1.Items.Count
)].Bitmap;
end;
procedure TForm1.TMSFNCTreeView1GetNodeText(Sender: TObject;
 ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer;
 AMode: TTMSFNCTreeViewNodeTextMode; var AText: string);
begin
 AText := 'Lorem Ipsum is simply dummy text of the printing and
typesetting industry. Lorem Ipsum has been the industry''s standard
dummy text ever since the 1500s, when an unknown printer took a galley
of type and scrambled it to make a type specimen book';
end;
procedure TForm1.TMSFNCTreeView1GetNumberOfNodes(Sender: TObject;
 ANode: TTMSFNCTreeViewVirtualNode; var ANumberOfNodes: Integer);
begin
  if ANode.Level = -1 then
   ANumberOfNodes := 1000000;
end;
```

# tmssoftware; com

When resizing, the node heights will be recalculated, giving more space for the text, and thus decreasing the necessary height for a node to display all the contents.

# Checkbox / Radiobutton support

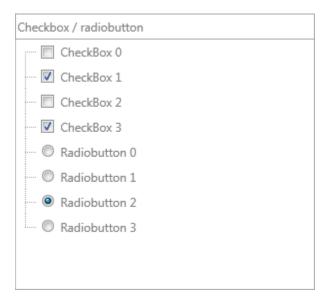

The TreeView has radiobutton and checkbox support. When specifying a check type through the OnGetNodeCheckType event or through the collection-based property CheckTypes at node level a checkbox or radiobutto will be displayed. More information on interaction will be explained at the Interaction chapter.

var

# tmssoftware:com

```
n: TTMSFNCTreeViewNode;
  I: Integer;
begin
  TMSFNCTreeView1.BeginUpdate;
 TMSFNCTreeView1.ClearNodeList;
 TMSFNCTreeView1.ClearNodes;
 TMSFNCTreeView1.ClearColumns;
 TMSFNCTreeView1.Columns.Add.Text := 'Checkbox / radiobutton';
  for I := 0 to 3 do
 begin
    n := TMSFNCTreeView1.Nodes.Add;
   n.Text[0] := 'CheckBox ' + IntToStr(I);
   n.CheckTypes[0] := tvntCheckBox;
    if Odd(I) then
     n.Checked[0] := True;
  end;
  for I := 0 to 3 do
 begin
   n := TMSFNCTreeView1.Nodes.Add;
    n.Text[0] := 'Radiobutton ' + IntToStr(I);
   n.CheckTypes[0] := tvntRadioButton;
    if I = 2 then
     n.Checked[0] := True;
  end;
 TMSFNCTreeView1.EndUpdate;
end;
```

## **Extended nodes**

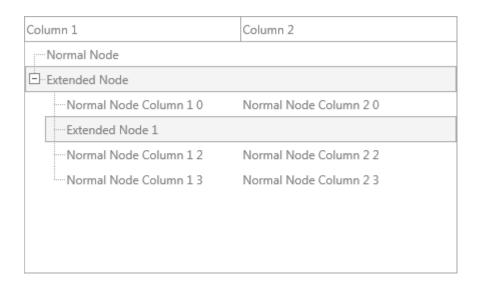

Extended nodes are nodes that are stretched over all columns and takes on the text of the first column. It is also styled with a different set of properties under NodesAppearance. An extended node is not editable and selectable by default. This behavior can be overriden in the Interaction property. To create an extended node, set the Extended property to true on a collection-based TreeView collection item node, or return True in the OnIsNodeExtended event. Below is a sample that demonstrates this.

```
var
  n, pn: TTMSFNCTreeViewNode;
  I: Integer;
begin
  TMSFNCTreeView1.BeginUpdate;
  TMSFNCTreeView1.ClearNodeList;
  TMSFNCTreeView1.ClearNodes;
  TMSFNCTreeView1.ClearColumns;
  TMSFNCTreeView1.Columns.Add.Text := 'Column 1';
  TMSFNCTreeView1.Columns.Add.Text := 'Column 2';
  pn := TMSFNCTreeView1.Nodes.Add;
  pn.Text[0] := 'Normal Node';

pn := TMSFNCTreeView1.Nodes.Add;
  pn.Text[0] := 'Extended Node';
  pn.Extended := True;
```

# tmssoftware; com

```
for I := 0 to 3 do
 begin
   n := TMSFNCTreeView1.AddNode(pn);
    if I = 1 then
   begin
     n.Text[0] := 'Extended Node ' + IntToStr(I);
     n.Extended := True;
    end
   else
   begin
     n.Text[0] := 'Normal Node Column 1 ' + IntToStr(I);
     n.Text[1] := 'Normal Node Column 2 ' + IntToStr(I);
    end;
 end;
 TMSFNCTreeView1.EndUpdate;
end;
```

#### Interaction

The TreeView supports interaction through mouse and keyboard. When clicking on a node that is selectable, the node is selected. When navigating with the keys up, down, home, end, page up or page down the selected node will be changed. Extended / disabled nodes are not selectable by default. The behaviour can be changed by changing the ExtendedSelectable and ExtendedEditable properties.

When the property MultiSelect is true, multiple nodes can be selected with the CTRL and SHIFT key with either the mouse or keyboard. The selected nodes can be retrieved with the SelectedNodeCount function and SelectedNodes property. Selection of nodes can be done with the SelectNode or SelectNodes method. The SelectNodes method takes an array of nodes. The above methods apply to a collection-based TreeView, but the same methods with the virtual method name are available for the virtual TreeView implementation.

When a node has children the left / right keys can expand or collapse the node and visualize or hide the children. Clicking on the expand / collapse node icon with the left mouse button will perform the same operation.

The keyboard and mouse can be used to edit the node text for each column when the column is configured to support editing. Additionally, when typing alphanumeric characters, the treeview will optionally search for the node that matches the lookup string and navigate to that node. To enable this feature, you need to set the Interaction.Lookup.Enabled property to true.

With the Interaction. Mouse Wheel Delta, the sensitivity can be controlled with which the treeview is scrolled. By default, a Mouse Wheel Delta of 1 means it scrolls the height of a single node. Setting it to 0.1 scrolls only 10% of the height of a node, setting it to 10, will scroll 10 times the height of a node.

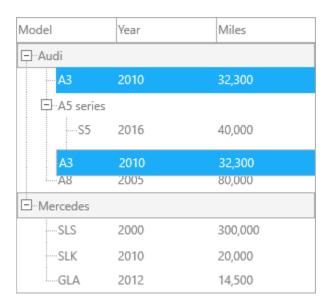

## Clipboard

Cut, Copy and Paste is supported when setting the Interaction. Clipboard Mode property to tcm TextOnly or tcm Full. The tcm TextOnly value only copies the text for each column and does not copy along other attributes such as the check and extended state, the node icon. The tcm Full clipboard mode copies all attributes of the node. Cut will first copy the node and then remove it from the treeview. When pasting, the focused node will act as the parent, if there is no node active the treeview will add the pasted node as a new node in the treeview. There are additional events that are triggered when performing a cut, copy or paste action.

## Reordering / Drag & Drop

When setting Interaction. Reorder to True, clicking on an already selected node will duplicate the node and attach it while dragging. When releasing the node over another node on the same level it will reorder the node the new location. Please note that touch scrolling is disabled when reordering is true on the selected node part. On the non-selected node parts, touch scrolling is still active.

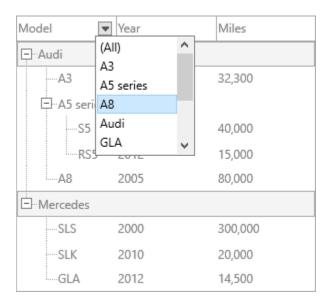

When setting Interaction. Drag Drop Mode to tdm Move or tdm Copy the same approach can be used as reordering, and will allow you to drop the node as a child node of the dropped node. Drag & drop takes precedence over reordering, and with drag & drop you cannot only move or copy nodes in the same treeview but also move nodes to another treeview.

# **Filtering**

When setting Columns[Index]. Filtering. Enabled := True; a filter dropdown button appears at the right side of the column. Clicking on the filter button will show a filter dropdown list with unique values from the node for that specific column. After clicking a value, the treeview shows a filtered list.

After filtering, the node that matches the chosen filter is shown.

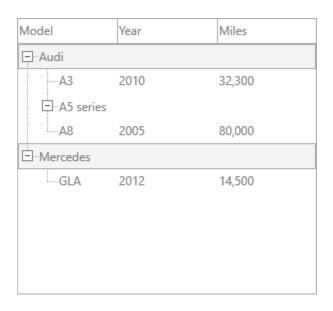

To clear filtering on a column, click the '(All)' entry in the filter list.

Note that filtering is also available programmatically. Below is a sample that filtes the nodes with an A:

```
ref: TTMSFNCTreeViewFilterData;
begin
   TMSFNCTreeView1.Filter.Clear;
   f := TMSFNCTreeView1.Filter.Add;
   f.Column := 0;
   f.Condition := '*A*';
   TMSFNCTreeView1.ApplyFilter;
end;
```

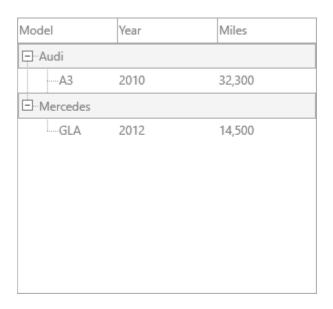

Additionally we want to filter values from the year 2010 or greater:

```
ref: TTMSFNCTreeViewFilterData;
begin
   TMSFNCTreeView1.Filter.Clear;
   f := TMSFNCTreeView1.Filter.Add;
   f.Column := 0;
   f.Condition := '*A*';

   f := TMSFNCTreeView1.Filter.Add;
   f.Column := 1;
   f.Condition := ' >= 2010';
```

TMSFNCTreeView1.ApplyFilter; end;

To clear all filtering programmatically, you can use the following code: TMSFNCTreeView1.RemoveFilters;

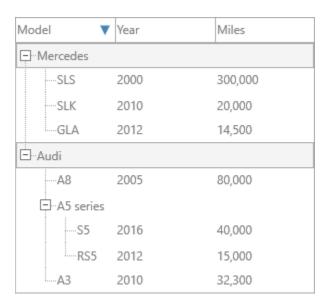

Note that if a child node matches a filter condition, the parent tree is also added.

## Sorting

Sorting can be performed on each column separately. When clicking on the column, the nodes are sorted and the treeview is updated. Sorting can be done for root nodes only, or recursive with an optional case sensitivity requirement. Below is a sample that sorts based on all nodes (recursive).

TMSFNCTreeView1.Columns[0].Sorting := tcsRecursive;

Sorting can also be done programmatically, with the following code, which will show the same result as the screenshot above.

TMSFNCTreeView1.Sort(0, True, False, nsmDescending);

### **Editing**

The TreeView supports inplace editing of nodes per column. Each column has the ability to specify an editor through the EditorType property. When editing is started, either by clicking on the text, or by pressing F2 on the keyboard the OnGetNodeText event is called to retrieve the text that needs to be placed inside the editor. To know if the OnGetNodeText event is called for drawing/calculation or for editing the AMode parameter can be used. If the OnGetNodeText event isn't used to return a different text when editing, the text of the node is used.

Below is a sample that demonstrates this. (Note that the code above is applied on a default TreeView instance)

TMSFNCTreeView1.Columns[2].EditorType := tcetEdit;

2012

When the editing is started, the OnGetNodeText event is called with a different mode. To initialize the editor with a different text the following code provides a sample to achieve this.

```
procedure TForm1.TMSFNCTreeView1GetNodeText(Sender: TObject;
   ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer;
   AMode: TTMSFNCTreeViewNodeTextMode; var AText: string);
begin
   case AMode of
    tntmEditing: AText := 'Editor Started !';
   end;
end;
end;
```

15,000

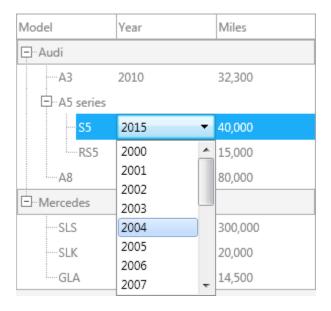

After editing is finished, the OnBeforeUpdateNode is called to allow making changes to the edited text or block updating the node if necessary. Additionally the OnCloseInplaceEditor event can be used to stop the editor from closing if the requirements of the text are not met.

Note that when editing is allowed on multiple columns, starting to edit a node will always start with the first not read-only column and then the tab key will jump to the next editable column.

Other than the default TEdit editor, a TMemo or TComboBox can be chosen to allow editing. A TMemo is typically used to allow a multi-line editor and a TComboBox to have a choice menu in case multiple values are possible. A sample that shows how to use the TComboBox as an inplace editor is shown in the sample below.

```
I: Integer;
begin
   TMSFNCTreeView1.Columns[1].EditorType := tcetComboBox;
   for I := 0 to 19 do
     TMSFNCTreeView1.Columns[1].EditorItems.Add(IntToStr(2000 + I));
end;
```

If the built-in editors are not sufficient, the TreeView supports using a custom editor as well, by setting the CustomEditor property to true.

# **Custom Editor**

The code below demonstrates how to use a custom editor, in this case a TTrackBar.

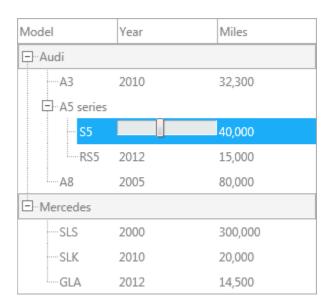

```
TMSFNCTreeView1.Columns[1].CustomEditor := True;

procedure TForm1.TMSFNCTreeView1BeforeUpdateNode(Sender: TObject;
   ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; var AText:
   string;
   var ACanUpdate: Boolean);

begin
   AText := FloatToStr((TMSFNCTreeView1.GetInplaceEditor as
TTrackBar).Value);
end;

procedure TForm1.TMSFNCTreeView1GetInplaceEditor(Sender: TObject;
   ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer;
   var ATransparent: Boolean;
   var AInplaceEditorClass: TTMSFNCTreeViewInplaceEditorClass);
begin
   AInplaceEditorClass := TTrackBar;
end;
```

After changing the value, the OnBeforeUpdateNode event is triggered which sets the value of the node text to the value of the trackbar.

```
RS5 2012 15,000
```

#### Customization

The TreeView supports a wide range of customization possibilities. Below is a sample how to implement the correct events for custom node drawing. Note that this sample starts from a default TreeView with nodes already added to the collection.

In the sample below the second column contains information on the build year of the car. To identify cars that are built in 2012 or later we want to draw a red ellipse in the top right corner of the text area for the year column.

```
procedure TForm1.TMSFNCTreeView1AfterDrawNodeText(Sender: TObject;
 ACanvas: TCanvas; ARect: TRectF; AColumn: Integer;
 ANode: TTMSFNCTreeViewVirtualNode; AText: string);
var
 v: Integer;
begin
  if TryStrToInt(AText, v) then
    if (AColumn = 1) and (v \ge 2012) then
    begin
      ACanvas.Fill.Kind := TBrushKind.Solid;
      ACanvas.Fill.Color := gcRed;
      ACanvas.FillEllipse(RectF(ARect.Right - 12, ARect.Top + 2,
ARect.Right - 2, ARect.Top + 12), 1);
    end;
  end;
end;
```

#### **Demos**

## Overview

The overview demo demonstrates variable node heights, programmatically expand and collapse as well as custom column appearance and toggling column visibility. The node text in the description column is HTML formatted and a progressbar is custom drawn inside the stock column. The last 2 columns amount and delivery method show the capabilities of editing through TEdit and TComboBox.

# **Properties**

The collection of columns. Please note that each property that affects appearance is not applied unless UseDefaultAppearance is set to False.  Columns[Index] → BottomFill The fill of the column when the Layout property is set to include tclBottom.  Columns[Index] → BottomFont The font of the column text when the Layout property is set to include tclBottom.  Columns[Index] → BottomFontColor The color of the font of the column text when the Layout property is set to include tclBottom.  Columns[Index] → BottomStroke The stroke of the column when the Layout property is set to include tclBottom.  Columns[Index] → CustomEditor Allows for a custom editor to be returned through the OnGetInplaceEditor event.  Columns[Index] → DisabledFontColor The color of the font of the nodes in disabled state.  Columns[Index] → EditorItems The items of the editor when using the tcetComboBox editor type.  Columns[Index] → EditorType The type of editor to use for each node in a column. The editor can be customized per node.  Columns[Index] → Fill The fill of a column.  Columns[Index] → Font The font of the nodes of a column.  Columns[Index] → Font The font of the nodes of a column.  Columns[Index] → Font The alignment of the text of the nodes of a column.  Columns[Index] → Name The name of the column.	BitmapContainer	Support for adding icons to nodes and to support image tags inside HTML formatted text.
Layout property is set to include tclBottom.  Columns[Index] → BottomFont  The font of the column text when the Layout property is set to include tclBottom.  Columns[Index] → BottomFontColor  The color of the font of the column text when the Layout property is set to include tclBottom.  Columns[Index] → BottomStroke  The stroke of the column when the Layout property is set to include tclBottom.  Columns[Index] → CustomEditor  Allows for a custom editor to be returned through the OnGetInplaceEditor event. of a column.	Columns[Index] → FontColor	
Columns[Index] → Name The name of the column.	Columns[Index] → HorizontalTextAlign	
	Columns[Index] → Name	The name of the column.

Columns[Index] → SelectedFontColor	The color of the font of the nodes in
	selected state.
Columns[Index] → Sorting	Configures sorting on a column.
Columns[Index] → Stroke	The stroke of the column.
Columns[Index] → TopFill	The fill of the column when the
	Layout property is set to include
	tclTop.
Columns[Index] → TopFont	The font of the column text when the
	Layout property is set to include
	tclTop.
Columns[Index] → TopFontColor	The color of the font of the column
	text when the Layout property is set
	to include tclTop.
Columns[Index] → TopStroke	The stroke of the column when the
	Layout property is set to include
	tclTop.
Columns[Index] → Trimming	The trimming of nodes of a column.
Columns[Index] → UseDefaultAppearance	Allows overriding the default
,	appearance of columns/nodes.
Columns[Index] → VerticalTextAlign	The vertical text alignment of nodes.
Columns[Index] → Visible	Sets the column visible / invisible.
Columns[Index] → Width	The width of the column.
Columns[Index] → WordWrapping	The word wrapping of nodes of a
1 1 11 3	column.
ColumnsAppearance	The overall appearance of columns.
- Pp-	Note that these properties are applied
	to all columns unless
	UseDefaultAppearance is set to False
	for a column.
ColumnsAppearance → BottomFill	The fill of the column when the
	Layout property is set to include
	tclBottom.
ColumnsAppearance → BottomFont	The font of the column text when the
- Pp-11 11 11 11 11 11 11 11 11 11 11 11 11	Layout property is set to include
	tclBottom.
ColumnsAppearance → BottomSize	The size of the bottom columns.
ColumnsAppearance → BottomStroke	The stroke of the column when the
	Layout property is set to include
	tclBottom.
ColumnsAppearance → BottomVerticalText	Allows displaying vertical text in the
- pp	

	columns bottom layout.
ColumnsAppearance → FillEmptySpaces	Allows filling empty spaces at the
	right side of the columns when the
	StretchScrollBars property is set to
	False.
ColumnsAppearance → Layouts	The layout of the columns which
	include tclTop and tclBottom.
ColumnsAppearance → Stretch	Allows stretching of columns.
ColumnsAppearance → StretchAll	Stretches all columns.
ColumnsAppearance → StretchColumn	Calculates all columns except for the
	column that matches this property.
	The StretchColumn is automatically
	given the leftover width after
	calculation.
ColumnsAppearance → TopFill	The fill of the column when the
	Layout property is set to include
	tclTop.
ColumnsAppearance → TopFont	The font of the column text when the
	Layout property is set to include
	tclTop.
ColumnsAppearance → TopSize	The size of the top columns.
ColumnsAppearance → TopStroke	The stroke of the column when the
	Layout property is set to include
	tclTop.
ColumnsAppearance → TopVerticalText	Allows displaying vertical text in the
	columns top layout.
ColumnStroke	The stroke between columns of a
	specific column.
Groups	The collection of groups. Please note
	that each property that affects
	appearance is not applied unless
	UseDefaultAppearance is set to False.
Groups[Index] → BottomFill	The fill of the group when the Layout
	property is set to include tglBottom.
Groups[Index] → BottomFont	The font of the group text when the
	Layout property is set to include
	tglBottom.
Groups[Index] → BottomFontColor	The color of the font of the group text
	when the Layout property is set to
	include tglBottom.
Groups[Index] → BottomStroke	The stroke of the group when the

	Layout property is set to include
	tglBottom.
Groups[Index] → EndColumn	The column on which the group ends.
oroaps[mack] > Endeotamm	Multiple groups can be added that
	cover multiple columns.
Groups[Index] → Name	The name of the group.
Groups[Index] → StartColumn	The column on which the group starts.
Groups[Index] → Text	The text of the group.
Groups[Index] → TopFill	The fill of the group when the Layout
eroaps[maex] > rop. m	property is set to include tglTop.
Groups[Index] → TopFont	The font of the group text when the
or daps[macx] > roprome	Layout property is set to include
	tglTop.
Groups[Index] → TopFontColor	The color of the font of the group text
c.caps[asx,] / ropromosom	when the Layout property is set to
	include tglTop.
Groups[Index] → TopStroke	The stroke of the group when the
The state of the s	Layout property is set to include
	tglTop.
Groups[Index] → UseDefaultAppearance	Allows overriding the default
	appearance of groups.
GroupsAppearance	The overall appearance of groups.
	Note that these properties are applied
	to all groups unless
	UseDefaultAppearance is set to False
	for a group.
GroupsAppearance → BottomFill	The fill of the group when the Layout
	property is set to include tglBottom.
GroupsAppearance → BottomFont	The font of the group text when the
	Layout property is set to include
	tglBottom.
GroupsAppearance → BottomFontColor	The color of the font of the group text
	when the Layout property is set to
	include tglBottom.
GroupsAppearance → BottomHorizontalTextAlign	The horizontal alignment of the group
	text when the Layout property is set
	to include tglBottom.
GroupsAppearance → BottomSize	The size of the bottom columns.
GroupsAppearance → BottomStroke	The stroke of the column when the
	Layout property is set to include
	tclBottom.

GroupsAppearance → BottomVerticalText	Allows displaying vertical text in the
	columns bottom layout.
GroupsAppearance → BottomVerticalTextAlign	The vertical alignment of the group
1 11	text when the Layout property is set
	to include tglBottom.
GroupsAppearance → FillEmptySpaces	Allows filling empty spaces at the
or other production of the state of the stat	right side of the columns when the
	StretchScrollBars property is set to
	False.
GroupsAppearance → Layouts	The layout of the groups which
Troups Appearance y Layouts	include tglTop and tglBottom.
GroupsAppearance → TopFill	The fill of the group when the Layout
GroupsAppearance 7 ropi in	property is set to include tglTop.
GroupsAppearance → TopFont	The font of the group text when the
GroupsAppearance 7 ropi one	Layout property is set to include
	tglTop.
GroupsAppearance → TopFontColor	The color of the font of the group text
GroupsAppearance / ropi onteotor	when the Layout property is set to
	include tglTop.
GroupsAppearance → TopHorizontalTextAlign	The horizontal alignment of the group
GroupsAppearance -> Topriorizontatrextatign	text when the Layout property is set
CroupsAppearance \ TenSize	to include tglTop.
GroupsAppearance → TopSize	The size of the top columns.  The stroke of the column when the
GroupsAppearance → TopStroke	
	Layout property is set to include
Consumation Control Nation I Tour	tglTop.
GroupsAppearance → TopVerticalText	Allows displaying vertical text in the
Constant Annual National Total Alice	columns top layout.
GroupsAppearance → TopVerticalTextAlign	The vertical alignment of the group
	text when the Layout property is set
	to include tglTop.
Interaction	Set of properties for configuring
	mouse and keyboard interaction.
Interaction → ClipboardMode	Sets the mode for clipboard support.
Interaction → ColumnAutoSizeOnDblClick	Allows auto sizing of a column on
	double-click. Please note that this will
	only apply auto sizing on the visible
	nodes.
Interaction → ColumnSizing	Allows for column sizing.
Interaction → DragDropMode	When true, the treeview supports drag
	& drop of nodes.

Interaction → ExtendedEditable	Allows extended nodes to be editable.
Interaction → ExtendedSelectable	Allows extended nodes to be
	selectable.
Interaction → KeyboardEdit	Allows keyboard editing when editing
	is supported.
Interaction → Lookup	When true, the treeview supports
	keyboard lookup.
Interaction → MouseEditMode	Sets the mouse edit mode when
	editing is supported.
Interaction → MultiSelect	Allows for multiple node selection
	with mouse and keyboard.
Interaction → ReadOnly	Sets the TreeView in readonly mode,
	which disables node editing on all
	columns.
Interaction → Reorder	When true, the treeview supports
	reordering of nodes.
Interaction → TouchScrolling	Allows/disallows touch scrolling. When
	True, scrolling can be done by flicking
	the mouse (finger) up / down on the
	TreeView.
Nodes	The nodes collection when a
	collection-based TreeView is being
	used.
Nodes[Index] → Enabled	When False, disables editing and
	selection.
Nodes[Index] → Expanded	When True and the node has children,
	expands the child nodes. When False,
	collapses the child nodes.
Nodes[Index] → Extended	When True, applies the extended
	properties under NodesAppearance
	and only uses and stretches the first
	column text over the number of
	columns.
Nodes[Index] → Nodes	The child nodes collection.
Nodes[Index] → Values	The values collection that is
	represented in a column for each
	node.
Nodes[Index] → Values[Index] → Checked	Sets whether the node value for a
N 1 5 1 1 2 2 4 1 7 2 6 1 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7 7	specific column is checked.
Nodes[Index] → Values[Index] → CheckType	Specifies the check type of a node
	value. The type can be a radiobutton

	or a checkbox.
Nodes[Index] → Values[Index] → CollapsedIcon	The icon in collapsed state.
Nodes[Index] → Values[Index] →	The icon in collapsed state for high
CollapsediconLarge	DPI / retina screens.
Nodes[Index] → Values[Index] →	The icon name linked to a
CollapsedIconLargeName	BitmapContainer in collapsed state for
Conapsediconzargename	high DPI / retina screens.
Nodes[Index] → Values[Index] → CollapseIconName	The icon name linked to a
	BitmapContainer in collapsed state.
Nodes[Index] → Values[Index] → ExpandedIcon	The icon in expanded state.
Nodes[Index] → Values[Index] →	The icon in expanded state for high
ExpandedIconLarge	DPI / retina screens.
Nodes[Index] → Values[Index] →	The icon name linked to a
ExpandedIconLargeName	BitmapContainer in expanded state for
	high DPI / retina screens.
Nodes[Index] → Values[Index] →	The icon name linked to a
ExpandedIconName	BitmapContainer in expanded state.
Nodes[Index] → Values[Index] → Text	The Text of a node.
NodesAppearance	The appearance for each node.
NodesAppearance → CollapseNodeIcon	The icon for the ExpandColumn in
	collapsed state.
NodesAppearance → CollapseNodeIconLarge	The icon for the ExpandColumn in
	collapsed state for high DPI / retina
	screens.
NodesAppearance → ColumnStroke	The stroke between columns.
NodesAppearance → DisabledFill	The fill of a node in disabled state.
NodesAppearance → DisabledFontColor	The color of the font of a node in
	disabled state.
NodesAppearance → DisabledStroke	The stroke of a node in disabled state.
NodesAppearance → ExpandColumn	The column that shows the expand /
	collapse node icons and is used to
	expand / collapse the nodes.
NodesAppearance → ExpandHeight	The height of the expand / collapse
	node icon area.
NodesAppearance → ExpandNodelcon	The icon for the ExpandColumn in
	expanded state.
NodesAppearance → ExpandNodelconLarge	The icon for the ExpandColumn in
	expanded state.
NodesAppearance → ExpandWidth	The width of the expand / collapse
	node icon area.

NodesAppearance → ExtendedDisabledFill	The fill of an extended node in
	disabled state.
NodesAppearance → ExtendedDisabledFontColor	The color of the font of an extended
	node in disabled state.
NodesAppearance → ExtendedDisabledStroke	The stroke of an extended node in
	disabled state.
NodesAppearance → ExtendedFill	The fill of an extended node.
NodesAppearance → ExtendedFont	The font of an extended node.
NodesAppearance → ExtendedFontColor	The color of the font of an extended
	node.
NodesAppearance → ExtendedSelectedFill	The fill of an extended node in
	selected state.
NodesAppearance → ExtendedSelectedFontColor	The color of the font of an extended
	node in selected state.
NodesAppearance → ExtendedSelectedStroke	The stroke of an extended node in
	selected state.
NodesAppearance → ExtendedStroke	The stroke of an extended node.
NodesAppearance → Fill	The fill of a node in normal state.
NodesAppearance → FixedHeight	The height of each node in case the
	HeightMode property is set to
	tnhmFixed.
NodesAppearance → Font	The font of a node.
NodesAppearance → FontColor	The color of the font of a node in
	normal state.
NodesAppearance → HeightMode	The HeightMode of the nodes. In case
	the HeightMode property is set to
	tnhmFixed, the FixedHeight property
	is used to determine a fixed height for
	each node. When the HeightMode
	property is set to tnhmVariable, the
	minimum height of a node is 25 and
	depending on the text calculation and
	properties such as wordwrapping /
	trimming and alignment the treeview
	automatically calculates the real node
	height on the fly. Mode information
	can be found in the chapter Fixed vs
	variable node height under Nodes.
NodesAppearance → LevelIndent	The size of the indenting used for
	different node levels (child nodes).
NodesAppearance → LineStroke	The stroke of the line used when

	ShowLines is true.
NodesAppearance → SelectedFill	The fill of a node in selected state.
NodesAppearance → SelectedFontColor	The color of the font of a node in
	selected state.
NodesAppearance → SelectedStroke	The stroke of a node in selected state.
NodesAppearance → SelectionArea	The area of selection indication. The
	selection area can be limited to the
	text only, include the icon and level
	indenting as well.
NodesAppearance → ShowFocus	Shows a focus border on the focused
	node.
NodesAppearance → ShowLines	Shows node and child node lines.
NodesAppearance → Stroke	The stroke of a node in normal state.
StretchScrollBars	Allows stretching of scrollbars to
	enable a more integrated look and
	feel.

# **Public Properties**

# TreeView

FocusedNode: TTMSFNCTreeViewNode	Returns the focused node (collection-based).
FocusedVirtualNode:	Returns the focused node (virtual).
TTMSFNCTreeViewVirtualNode	
	Gives access to the selected nodes based on
SelectedNodes[AIndex: Integer]:	the SelectedNodeCount property (collection-
TTMSFNCTreeViewNode	based).
SelectedVirtualNodes[AIndex:	Gives access to the selected nodes based on
Integer]:	the SelectedVirtualNodeCount property
TTMSFNCTreeViewVirtualNode	(virtual).

# Node (Virtual)

	An array of rectangles for node icons for each
BitmapRects	column.
	When the HeightMode is tnhmVariable, this property is set to true whenever a node height is calculated. The Height property contains the
Calculated	height of the node.
	An array of rectangles for node check types for
CheckRects	each column.
CheckStates	An array of Booleans for node check states for

	each column.
Children	The count of children of a node.
Expanded	Determines if the node is expanded / collapsed.
ExpandRects	An array of rectangles for expand / collapse node icons for each column.
Extended	Determines if the node is extended / normal.
Height	The height of the node.
Index	The index of the node relative to its parent.
Level	The level of the node.
Node	A reference to the collection-based node if a collection-based TreeView is used.
ParentNode	The row index of the parent node.
Row	The index of the node relative to the TreeView.
TextRects	An array of rectangles for the text of each column.
T . 161 11 1	The total count of children of a node. The total count includes the count of all levels of
TotalChildren	child nodes.

<u>Important notice</u>: When using one of the array properties, the length of the array will always be the same as the column count, yet the values that are included will only be valid if the width & height are larger than 0. When using one of those array properties for custom drawing keep in mind that drawing is only valid when the above criteria is met.

# Node (Collection-Based)

	Property to set the checked state of a node for
Checked[AColumn: Integer]: Boolean	a specific column.
	Property to set the check type of a node for a
CheckTypes[AColumn: Integer]:	specific column. The check type of a node can
TTMSFNCTreeViewNodeCheckType	be a radiobutton or a checkbox.
CollapsedIconNames[AColumn: Integer	The name of the icon in collapsed state of a
ALarge: Boolean]: String	node for a specific column.
CollapsedIcons[AColumn: Integer	The icon in collapsed state of a node for a
ALarge: Boolean]:	specific column.
TTMSFNCTreeViewBitmap	
ExpandedIconNames[AColumn: Integer	The name of the icon in expanded state of a
ALarge: Boolean]: String	node for a specific column.
ExpandedIcons[AColumn: Integer	The icon in expanded state of a node for a
ALarge: Boolean]:	specific column.
TTMSFNCTreeViewBitmap	
Text[AColumn: Integer]: String	The text of a node for a specific column.

VirtualNode:	A reference to the virtual node.
TTMSFNCTreeViewVirtualNode	

## **Events**

Note that for each event, the TTMSFNCTreeViewVirtualNode is being passed as a parameter. This class is used in virtual mode and in collection-based mode but has a property Node to easily access the collection item in case a collection-based TreeView is used.

	editing.
OnCloseInplaceEditor	Event called when the inplace editor is closed.
	Event for customization of the inplace editor
OnCustomizeInplaceEditor	after it has been created.
	Event triggered when a value of the filter
	listbox is selected and the condition needs to
	be applied. In this event you can additionally
OnFilterSelect	customize the condition.
	Event called to get the horizontal alignment of
OnGetColumnHorizontalTextAlign	the text in a column.
OnGetColumnText	Event called to get the text of a column.
	Event called to get the trimming of the text in
OnGetColumnTrimming	a column.
	Event called to get the vertical alignment of
OnGetColumnVerticalTextAlign	the text in a column.
	Event called to get the word wrapping of the
OnGetColumnWordWrapping	text in a column.
	Event called to get the text for a specific
OnGetGroupText	group.
OnGetInplaceEditor	Event called to use a custom inplace editor.
	Event called to get the inplace editor
OnGetInplaceEditorRect	rectangle.
OnGetNodeCheckType	Event called to get the check type of a node.
	Event called to get the color of a node in
OnGetNodeColor	normal state.
	Event called to get the color of a node in
OnGetNodeDisabledColor	disabled state.
	Event called to get the color of the text of a
OnGetNodeDisabledTextColor	node in disabled state.
	Event called to get the height of a node in
	case the NodesAppearance.HeightMode is set
OnGetNodeHeight	to tnhmVariable.
	Event called to get the horizontal text
OnGetNodeHorizontalTextAlign	alignment of a node.
OnGetNodelcon	Event called to get the icon of a node.
	Event called to get the color of a node in
OnGetNodeSelectedColor	selected state.
	Event called to get the text color of a node in
OnGetNodeSelectedTextColor	selected state.
OnGetNodeText	Event called to get the text of a node.
	Event called to get the color of the text of a
OnGetNodeTextColor	node.
	Event called to get the trimming of the text of
OnGetNodeTrimming	a node.
OnGetNodeVerticalTextAlign	Event called to get the vertical text alignment

	of a node.
	Event called to get the word wrapping of the
OnGetNodeWordWrapping	text of a node.
OnGetNumberOfNodes	Event called to get the number of nodes.
	Event called when the TreeView scrolls
OnHScroll	horizontally.
	Event called to determine if a node is checked
OnlsNodeChecked	or not.
	Event called to determine if a node is enabled
OnIsNodeEnabled	or not.
	Event called to determine if a node is
OnIsNodeExpanded	expanded or not.
	Event called to determine if a node is
OnIsNodeExtended	extended or not.
	Event triggered when applying a column filter
	operation. In this event you can additionally
	change or add values you wish to see in the
OnNeedFilterDropDownData	dropdown window.
	Event called when an anchor is clicked in the
OnNodeAnchorClick	HTML formatted text of a node.
	Event called when the node is changed after
OnNodeChanged	editing.
OnNodeClick	Event called when a node is clicked.
OnNodeDblClick	Event called when a node is double clicked.
	Event called when the TreeView scrolls
OnVScroll	vertically.

# **Procedures and functions**

# TreeView

AddNode(AParentNode: TTMSFNCTreeViewNode = nil): TTMSFNCTreeViewNode	Adds a node to the node collection (collection-based). An optional parent node parameter can be passed to add the node as a child node.
AddVirtualNode(AParentNode: TTMSFNCTreeViewVirtualNode = nil): TTMSFNCTreeViewVirtualNode	Adds a node to the virtual node list (virtual). An optional parent node parameter can be passed to add the node as a child node.
AutoSizeColumn(ACol: Integer)	Autosizes a column.
BeginUpdate	Blocks all updates to increase performance. Must be paired with an EndUpdate.
CancelEditing	Cancels editing when editing is active.
CheckNode(ANode: TTMSFNCTreeViewNode; AColumn: Integer; ARecurse: Boolean = False)	Checks the node for a specific column (collection-based).

CheckVirtualNode(ANode:	Checks the node for a specific column
TTMSFNCTreeViewVirtualNode;	(virtual).
AColumn: Integer; ARecurse: Boolean	(The Education
= False)	
ClearColumns	Removes all columns.
ClearNodeList	Clears the internal node list. (virtual)
	Removes all nodes from the node collection
ClearNodes	(collection-based).
	Collapses all nodes and child nodes (collection-
CollapseAll	based).
CollapseAllVirtual	Collapsed all nodes and child nodes (virtual).
CollapseNode(ANode:	Collapses a specific node (collection-based).
TTMSFNCTreeViewNode; ARecurse:	
Boolean = False)	
CollapseVirtualNode(ANode:	Collapse a specific node (virtual).
TTMSFNCTreeViewVirtualNode;	
ARecurse: Boolean = False)	
EditNode(ANode:	Starts editing a specific node (collection-
TTMSFNCTreeViewNode; AColumn:	based).
Integer)	Charle adition a appoific mode (virtual)
EditVirtualNode(ANode: TTMSFNCTreeViewVirtualNode;	Starts editing a specific node (virtual).
AColumn: Integer)	
Acotumii. integer)	Bundles all updates into one update for
	performance. Needs to be paired with a
EndUpdate	BeginUpdate.
ExpandAll	Expands all nodes (collection-based).
ExpandAllVirtual	Expands all nodes (virtual).
ExpandNode(ANode:	Expands a specific node (collection-based).
TTMSFNCTreeViewNode; ARecurse:	(00000000000000000000000000000000000000
Boolean = False)	
ExpandVirtualNode(ANode:	Expands a specific node (virtual).
TTMSFNCTreeViewVirtualNode;	
ARecurse: Boolean = False)	
FindColumnByName(AName: String):	Finds a column with a specific name.
TTMSFNCTreeViewColumn	
FindColumnIndexByName(AName:	Finds a column index with a specific name.
String): Integer	
FindGroupByName(AName: String):	Finds a group with a specific name.
TTMSFNCTreeViewGroup	
FindGroupIndexByName(AName:	Finds a group index with a specific name.
String): Integer	Detume the Gost shill not be for and
GetFirstChildNode(ANode:	Returns the first child node of a node
TTMSFNCTreeViewNode):	(collection-based).
TTMSFNCTreeViewNode	

GetFirstChildVirtualNode(ANode:	Returns the first child node of a node (virtual).
TTMSFNCTreeViewVirtualNode):	
TTMSFNCTreeViewVirtualNode	
GetFirstRootNode:	Returns the first root node (collection-based).
TTMSFNCTreeViewNode	
GetFirstRootVirtualNode:	Returns the first root node (virtual).
TTMSFNCTreeViewVirtualNode	
GetHorizontalScrollPosition: Double	Returns the horizontal scroll position.
	Returns the inplace editor when active. The
GetInplaceEditor:	GetInplaceEditor function will return nil when
TTMSFNCTreeViewInplaceEditor	the editor is not active.
GetLastChildNode(ANode:	Returns the last child node of a node (collection-based).
TTMSFNCTreeViewNode):	(collection-based).
TTMSFNCTreeViewNode	Detumes the cleat shill had a of a rade (sintual)
GetLastChildVirtualNode(ANode:	Returns the last child node of a node (virtual).
TTMSFNCTreeViewVirtualNode):	
TTMSFNCTreeViewVirtualNode	Determent the last weeds (sell-setting bosses)
GetLastNode: TTMSFNCTreeViewNode	Returns the last node (collection-based).
GetLastRootNode:	Returns the last root node (collection-based).
TTMSFNCTreeViewNode	Determent had been read a (circus)
GetLastRootVirtualNode:	Returns the last root node (virtual).
TTMSFNCTreeViewVirtualNode	
GetLastVirtualNode:	Returns the last node (virtual).
TTMSFNCTreeViewVirtualNode

TTMSFNCTreeViewNode):	node (collection-based).
TTMSFNCTreeViewNode	
GetNextSiblingVirtualNode(ANode:	Returns the next sibling node starting from a
TTMSFNCTreeViewVirtualNode):	node (virtual).

TTMSFNCTreeViewVirtualNode	
GetNextVirtualNode(ANode:	Returns the next node starting from the
TTMSFNCTreeViewVirtualNode):	previous node (virtual).
TTMSFNCTreeViewVirtualNode	
GetNodeChildCount(ANode:	Returns the child count for a specific node
TTMSFNCTreeViewNode): Integer	(collection-based).
GetParentNode(ANode:	Returns the parent node for a specific node
TTMSFNCTreeViewNode):	(collection-based).
TTMSFNCTreeViewNode	
GetParentVirtualNode(ANode:	Returns the parent node for a specific node
TTMSFNCTreeViewVirtualNode):	(virtual).
TTMSFNCTreeViewVirtualNode	
GetPreviousChildNode(ANode:	Returns the previous child node starting from a
TTMSFNCTreeViewNode; AStartNode:	parent node and the previous node (collection-
TTMSFNCTreeViewNode):	based).
TTMSFNCTreeViewNode	
GetPreviousChildVirtualNode(ANode:	Returns the previous child node starting from a
TTMSFNCTreeViewVirtualNode;	parent node and the previous node (virtual).
AStartNode:	
TTMSFNCTreeViewVirtualNode):	
TTMSFNCTreeViewVirtualNode	
GetPreviousNode(ANode:	Returns the previous node starting from a node
TTMSFNCTreeViewNode):	(collection-based).
TTMSFNCTreeViewNode	
GetPreviousSiblingNode(ANode:	Returns the previous sibling starting from a
TTMSFNCTreeViewNode):	node (collection-based).
TTMSFNCTreeViewNode	
GetPreviousSiblingVirtualNode(ANode:	Returns the previous sibling starting from a
TTMSFNCTreeViewVirtualNode):	node (virtual).
TTMSFNCTreeViewVirtualNode	
GetPreviousVirtualNode(ANode:	Returns the previous node starting from a node
TTMSFNCTreeViewVirtualNode):	(virtual).
TTMSFNCTreeViewVirtualNode	
GetRootNodeByIndex(AIndex: Integer):	Returns a root node by a specific index
TTMSFNCTreeViewNode	(collection-based).
GetRootVirtualNodeByIndex(AIndex:	Returns a root node by a specific index
Integer):	(virtual).
TTMSFNCTreeViewVirtualNode	
GetTotalColumnWidth: Double	Returns the total column width.

GetVerticalScrollPosition: Double	Returns the vertical scroll position.
GetVirtualNodeChildCount(ANode:	Returns the child count of a specific node
TTMSFNCTreeViewVirtualNode):	(virtual).
Integer	
HorizontalScrollBar: TScrollBar	Returns the horizontal scrollbar.
	Initializes a sample (the same sample
	initialized at designtime when dropping a new
InitSample	instance of TTMSFNCTreeView).
InsertNode(AIndex: Integer;	Inserts a new node on a specific index and
AParentNode: TTMSFNCTreeViewNode	parent node (collection based).
= nil): TTMSFNCTreeViewNode	
InsertVirtualNode(AIndex: Integer;	Inserts a new node on a specific index and
AParentNode:	parent node (virtual).
TTMSFNCTreeViewVirtualNode = nil):	
TTMSFNCTreeViewVirtualNode	
IsColumnVisible(ACol: Integer):	Returns if the specified column is visible or
Boolean	hidden.
IsEditing: Boolean	Returns if editing is active.
IsNodeSelectable(ANode:	Returns if a node is selectable (collection-
TTMSFNCTreeViewNode): Boolean	based).
IsNodeSelected(ANode:	Returns if a node is selected (collection-
TTMSFNCTreeViewNode): Boolean	based).
IsVirtualNodeSelectable(ANode:	Returns if a node is selectable (virtual).
TTMSFNCTreeViewVirtualNode):	
Boolean	
IsVirtualNodeSelected(ANode:	Returns if a node is selected (virtual).
TTMSFNCTreeViewVirtualNode): Boolean	
RemoveNodeChildren(ANode:	Removes all children of a specific node
TTMSFNCTreeViewNode)	(collection-based).
RemoveSelectedNodes	Removes all selected nodes (collection-based).
RemoveSelectedVirtualNodes	Removes all selected nodes (virtual).
RemoveVirtualNode(ANode:	Removes a node (virtual).
TTMSFNCTreeViewVirtualNode)	( Land of the land)
RemoveVirtualNodeChildren(ANode:	Removes all children of a specific node
TTMSFNCTreeViewVirtualNode)	(virtual).
D	Restores scroll position after it has been saved
RestoreScrollPosition	with SaveScrollPosition.
SaveScrollPosition	Saves the scroll position. Restoring the scroll
	position is done with RestoreScrollPosition.
ScrollToNode(ANode: TTMSFNCTreeViewNode;	Scrolls to a specific node. Additional parameters can be passed to scroll only if not
AScrollifNotVisible: Boolean = False;	visible, and the scroll position when the node

Toggles the state of a checkbox or radiobutton when used in a node column (virtual).  Toggles the expand/collapse state of a node (virtual).  Unchecks a node (collection-based).
Integer; ARecurse: Boolean = False) ToggleCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False) ToggleVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; ARecurse: Boolean = False) UnCheckNode(ANode: TTMSFNCTreeViewNode; AColumn: Integer; ARecurse: Boolean = False) UnCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False)	based).  Toggles the state of a checkbox or radiobutton when used in a node column (virtual).  Toggles the expand/collapse state of a node (virtual).  Unchecks a node (collection-based).  Unchecks a node (virtual).
Integer; ARecurse: Boolean = False) ToggleCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False) ToggleVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; ARecurse: Boolean = False) UnCheckNode(ANode: TTMSFNCTreeViewNode; AColumn: Integer; ARecurse: Boolean = False) UnCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False) UnSelectAllNodes	based).  Toggles the state of a checkbox or radiobutton when used in a node column (virtual).  Toggles the expand/collapse state of a node (virtual).  Unchecks a node (collection-based).  Unchecks a node (virtual).  Unselects all nodes (collection-based).
Integer; ARecurse: Boolean = False) ToggleCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False) ToggleVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; ARecurse: Boolean = False) UnCheckNode(ANode: TTMSFNCTreeViewNode; AColumn: Integer; ARecurse: Boolean = False) UnCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False) UnSelectAllNodes UnSelectAllVirtualNodes	based).  Toggles the state of a checkbox or radiobutton when used in a node column (virtual).  Toggles the expand/collapse state of a node (virtual).  Unchecks a node (collection-based).  Unchecks a node (virtual).  Unselects all nodes (collection-based).  Unselects all nodes (virtual).
Integer; ARecurse: Boolean = False) ToggleCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False) ToggleVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; ARecurse: Boolean = False) UnCheckNode(ANode: TTMSFNCTreeViewNode; AColumn: Integer; ARecurse: Boolean = False) UnCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False) UnSelectAllNodes UnSelectAllVirtualNodes UnSelectNode(ANode:	based).  Toggles the state of a checkbox or radiobutton when used in a node column (virtual).  Toggles the expand/collapse state of a node (virtual).  Unchecks a node (collection-based).  Unchecks a node (virtual).  Unselects all nodes (collection-based).
Integer; ARecurse: Boolean = False)  ToggleCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False)  ToggleVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; ARecurse: Boolean = False)  UnCheckNode(ANode: TTMSFNCTreeViewNode; AColumn: Integer; ARecurse: Boolean = False)  UnCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False)  UnSelectAllNodes  UnSelectAllVirtualNodes  UnSelectNode(ANode: TTMSFNCTreeViewNode)	based).  Toggles the state of a checkbox or radiobutton when used in a node column (virtual).  Toggles the expand/collapse state of a node (virtual).  Unchecks a node (collection-based).  Unchecks a node (virtual).  Unselects all nodes (collection-based).  Unselects all nodes (virtual).  Unselects a specific node (collection-based).
Integer; ARecurse: Boolean = False) ToggleCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False) ToggleVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; ARecurse: Boolean = False) UnCheckNode(ANode: TTMSFNCTreeViewNode; AColumn: Integer; ARecurse: Boolean = False) UnCheckVirtualNode(ANode: TTMSFNCTreeViewVirtualNode; AColumn: Integer; ARecurse: Boolean = False) UnSelectAllNodes UnSelectAllVirtualNodes	based).  Toggles the state of a checkbox or radiobutton when used in a node column (virtual).  Toggles the expand/collapse state of a node (virtual).  Unchecks a node (collection-based).  Unchecks a node (virtual).  Unselects all nodes (collection-based).  Unselects all nodes (virtual).

UnSelectVirtualNode(ANode:	Unselects a specific node (virtual).
TTMSFNCTreeViewVirtualNode)	
UnSelectVirtualNodes(ANodes:	Unselects an array of nodes (virtual).
TTMSFNCTreeViewVirtualNodeArray)	
VerticalScrollBar: TScrollBar	Returns the vertical scrollbar.
	Returns a column index at a specific X and Y
XYToColumnSize(X, Y: Single): Integer	coordinate.
XYToNode(X, Y: Double):	Returns a node at a specific X and Y coordinate
TTMSFNCTreeViewVirtualNode	(virtual).
XYToNodeAnchor(ANode:	Returns a node anchor at a specific X and Y
TTMSFNCTreeViewVirtualNode; X, Y:	coordinate.
Single): TTMSFNCTreeViewNodeAnchor	
XYToNodeCheck(ANode:	Returns a node checkbox or radiobutton area
TTMSFNCTreeViewVirtualNode; X, Y:	at a specific X and Y coordinate.
Single): TTMSFNCTreeViewNodeCheck	
XYToNodeExpand(ANode:	Returns a node expand / collapse area at a
TTMSFNCTreeViewVirtualNode; X, Y:	specific X and Y coordinate.
Single): Boolean	
XYToNodeTextColumn(ANode:	Returns the column of the text of a specific
TTMSFNCTreeViewVirtualNode; X, Y:	node at a specific X and Y coordinate.
Single): Integer	

# Node (Virtual)

Collapse(ARecurse: Boolean = False)	Collapses the child nodes.
Expand(ARecurse: Boolean = False)	Expands the child nodes.
GetChildCount: Integer	Returns the count of child nodes.
GetFirstChild:	Returns the first child node.
TTMSFNCTreeViewVirtualNode	
GetLastChild:	Returns the last child node.
TTMSFNCTreeViewVirtualNode	
GetNext:	Returns the next node.
TTMSFNCTreeViewVirtualNode	
GetNextChild(ANode:	Returns the next child node.
TTMSFNCTreeViewVirtualNode):	
TTMSFNCTreeViewVirtualNode	
GetNextSibling:	Returns the next sibling node.
TTMSFNCTreeViewVirtualNode	
GetParent:	Returns the parent node.
TTMSFNCTreeViewVirtualNode	
GetPrevious:	Returns the previous node.
TTMSFNCTreeViewVirtualNode	
GetPreviousChild(ANode:	Returns the previous child node.
TTMSFNCTreeViewVirtualNode):	
TTMSFNCTreeViewVirtualNode	

GetPreviousSibling: TTMSFNCTreeViewVirtualNode	Returns the previous sibling node.
RemoveChildren	Removes all children.

# Node (Collection-Based)

Collapse(ARecurse: Boolean = False)	Collapses the child nodes.
Expand(ARecurse: Boolean = False)	Expands the child nodes.
GetChildCount: Integer	Returns the count of child nodes.
GetFirstChild: TTMSFNCTreeViewNode	Returns the first child node.
GetLastChild: TTMSFNCTreeViewNode	Returns the last child node.
GetNext: TTMSFNCTreeViewNode	Returns the next node.
GetNextChild(ANode: TTMSFNCTreeViewNode): TTMSFNCTreeViewNode	Returns the next child node.
GetNextSibling: TTMSFNCTreeViewNode	Returns the next sibling node.
GetParent: TTMSFNCTreeViewNode	Returns the parent node.
GetPrevious: TTMSFNCTreeViewNode	Returns the previous node.
GetPreviousChild(ANode: TTMSFNCTreeViewNode): TTMSFNCTreeViewNode	Returns the previous child node.
GetPreviousSibling: TTMSFNCTreeViewNode	Returns the previous sibling node.
RemoveChildren	Removes all children.

# TTMSFNCCheckedTreeView

The TTMSFNCCheckedTreeView inherits from TTMSFNCTreeView and adds additional functionality.

The TTMSFNCCheckedTreeView adds a checkbox for each node by default. The behaviour is identical to the TTMSFNCTreeView but saves the code for adding a checkbox to each node.

# TMS Mini HTML rendering engine

Another core technology used among many components is a small fast & lightweight HTML rendering engine. This engine implements a childset of the HTML standard to display formatted text. It supports following tags:

B: Bold tag

<B> : start bold text
</B> : end bold text

Example: This is a <B>test</B>

U: Underline tag

<U>: start underlined text</u></U>: end underlined text

Example: This is a <U>test</U>

I: Italic tag

<I> : start italic text
</I> : end italic text

Example: This is a <I>test</I>

S: Strikeout tag

<S> : start strike-through text
 : end strike-through text

Example: This is a <S>test

#### A: anchor tag

<A href="value"> : text after tag is an anchor. The 'value' after the href identifier is the anchor. This can be an URL (with ftp,http,mailto,file identifier) or any text.
If the value is an URL, the shellexecute function is called, otherwise, the anchor value can be found in the OnAnchorClick event </A> : end of anchor

Examples: This is a <A href= "mailto:myemail@mail.com">test</A>
This is a <A href="http://www.tmssoftware.com">test</A>

This is a <A href="somevalue">test</A>

### FONT: font specifier tag

<PONT face='facevalue' size='sizevalue' color='colorvalue' bgcolor='colorvalue'> : specifies font of text after tag.

with

- face: name of the font
- size: HTML style size if smaller than 5, otherwise pointsize of the font
- color: font color with either hexidecimal color specification or color constant name, ie gcRed,gcYellow,gcWhite... etc
- bgcolor: background color with either hexidecimal color specification or color constant name </FONT>: ends font setting

Examples: This is a <FONT face="Arial" size="12" color="gcRed">test</FONT> This is a <FONT face="Arial" size="12" color="#FF0000">test</FONT>

## P: paragraph

<P align="alignvalue" [bgcolor="colorvalue"] [bgcolorto="colorvalue"]>: starts a new paragraph, with left, right or center alignment. The paragraph background color is set by the optional bgcolor parameter. If bgcolor and bgcolorto are specified, a gradient is displayed ranging from begin to end color.

</P>: end of paragraph

Example: <P align="right">This is a test</P>
Example: <P align="center">This is a test</P>

Example: <P align="left" bgcolor="#ff0000">This has a red background</P>

Example: <P align="right" bgcolor="gcYellow">This has a yellow background</P>

Example: <P align="right" bgcolor="gcYellow" bgcolorto="gcRed">This has a gradient

background</P>\*

#### HR: horizontal line

<HR>: inserts linebreak with horizontal line

BR: linebreak

<BR>: inserts a linebreak

## BODY: body color / background specifier

<BODY bgcolor="colorvalue" [bgcolorto="colorvalue"] [dir="v|h"] background="imagefile
specifier">: sets the background color of the HTML text or the background bitmap file

Example: <BODY bgcolor="gcYellow">: sets background color to yellow

<BODY background="file://c:\test.bmp"> : sets tiled background to file test.bmp
<BODY bgcolor="gcYellow" bgcolorto="gcWhite" dir="v"> : sets a vertical gradient from yellow
to white

#### IND: indent tag

This is not part of the standard HTML tags but can be used to easily create multicolumn text <IND x="indent"> : indents with "indent" pixels

#### Example:

This will be  $\langle IND x = "75" \rangle$  indented 75 pixels.

#### IMG: image tag

<IMG src="specifier:name" [align="specifier"] [width="width"] [height="height"]
[alt="specifier:name"] > : inserts an image at the location

specifier can be: name of image in a BitmapContainer

Optionally, an alignment tag can be included. If no alignment is included, the text alignment with respect to the image is bottom. Other possibilities are: align="top" and align="middle"

The width & height to render the image can be specified as well. If the image is embedded in anchor tags, a different image can be displayed when the mouse is in the image area through the Alt attribute.

## Examples:

This is an image <IMG src="name">

## CHILD: childscript tag

<CHILD> : start childscript text
</CHILD> : end childscript text

Example: This is <SUP>9</SUP>/<CHILD>16</CHILD> looks like 9/16

#### SUP: superscript tag

<SUP> : start superscript text </SUP> : end superscript text

#### UL: list tag

<UL> : start unordered list tag </UL> : end unordered list

Example: <UL>
<LI>List item 1
<LI>List item 2
<UL>
<LI> Child list item A
<LI> Child list item B
</UL>
<LI>List item 3
</UL>

#### LI: list item

<LI [type="specifier"] [color="color"] [name="imagename"]>: new list item specifier can be "square", "circle" or "image" bullet. Color sets the color of the square or circle bullet. Imagename sets the PictureContainer image name for image to use as bullet

#### SHAD: text with shadow

<SHAD> : start text with shadow </SHAD> : end text with shadow

#### Z: hidden text

<Z>: start hidden text </Z>: end hidden text

#### Special characters

Following standard HTML special characters are supported:

< : less than : < &gt; : greater than : >

& amp; : & & & quot; : "

Enbsp; : non breaking space Etrade; : trademark symbol

€ : euro symbol § : section symbol © : copyright symbol ¶ : paragraph symbol
